## JANUARY 2021

Release Date: April 2, 2021

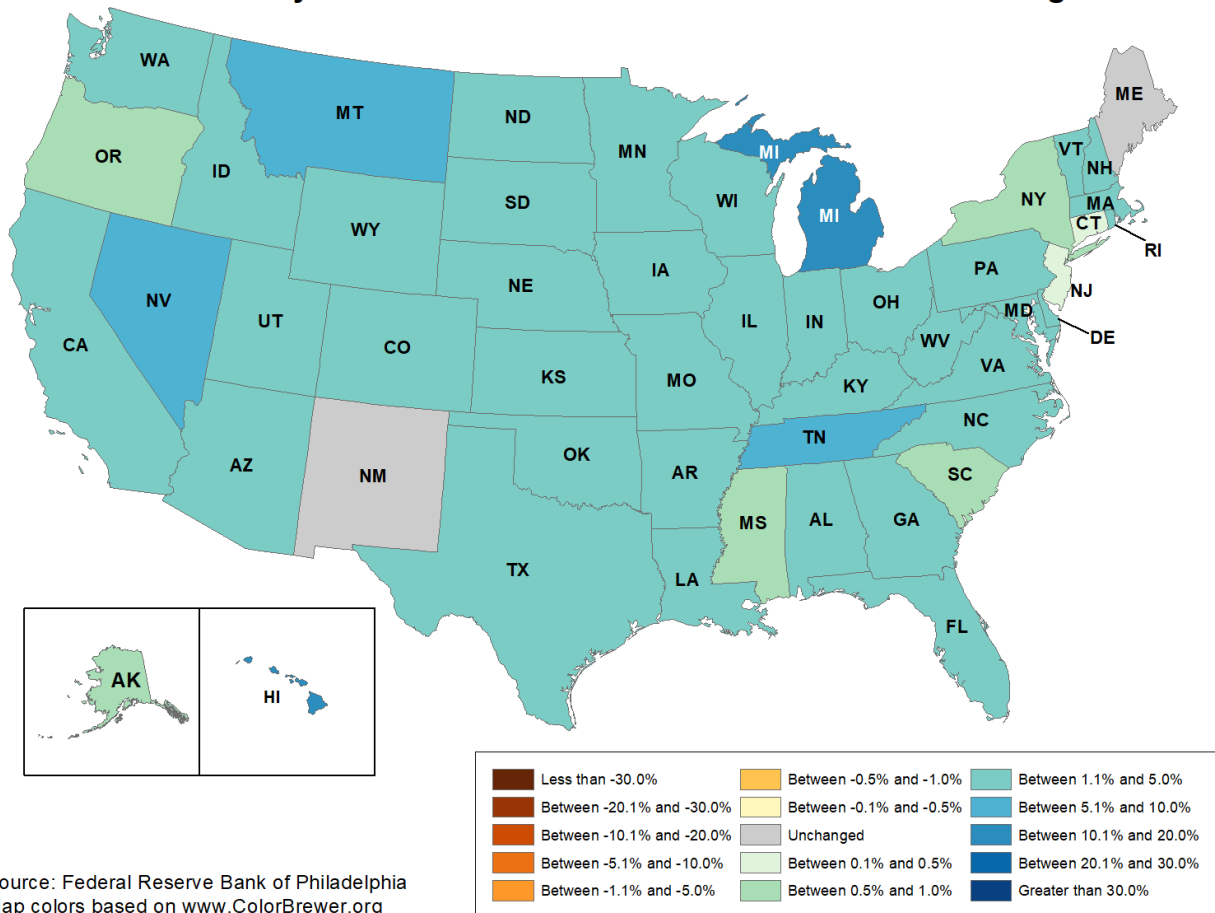

The Federal Reserve Bank of Philadelphia has released the coincident indexes for the 50 states for January 2021. Over the past three months, the indexes increased in 48 states and remained stable in two states, for a three-month diffusion index of 96. Additionally, in the past month, the indexes increased in 46 states, decreased in two states, and remained stable in two, for a one-month diffusion index of 88. For comparison purposes, the Philadelphia Fed has also developed a similar coincident index for the entire United States. The Philadelphia Fed's U.S. index increased 0.9 percent over the past three months and 0.4 percent in January.

\*\* See the **Potential Impacts of the Coronavirus (COVID-19) Pandemic on the January 2021 State Unemployment Rates** and **South Carolina Employment and Wages Data** on the third page.

\*\*\* **Greater volatility of the Coincident Index has prompted an expanded map scale, and more discussion of this volatility will be forthcoming.**

The next release date of the state coincident indexes will be April 9, 2021.

## THIRD DISTRICT COINCIDENT INDEXES: JANUARY 2021

### *Pennsylvania*

In the three months to January, the coincident index for Pennsylvania rose 1.2 percent. The level of payroll employment increased over the past three months but remained lower than that of February 2020. The unemployment rate increased during the three-month period and generally remained higher than the pre-pandemic level. In addition, average hours worked in manufacturing increased. Overall, Pennsylvania's economic activity as measured by the coincident index has fallen 7.8 percent over the past 12 months.

### *New Jersey*

In the three months to January, the coincident index for New Jersey increased 0.4 percent. The level of payroll employment was essentially unchanged over the past three months and remained lower than that of February 2020. The unemployment rate increased during the three-month period and generally remained at an elevated level. In addition, average hours worked in manufacturing fell sharply. Overall, New Jersey's economic activity as measured by the coincident index has fallen 5.8 percent over the past 12 months.

### *Delaware*

In the three months to January, the coincident index for Delaware rose 1.2 percent. The level of payroll employment was essentially unchanged over the past three months and remained lower than that of February 2020. The unemployment rate increased during the three-month period and generally remained higher than the pre-pandemic level. In addition, average hours worked in manufacturing fell. Overall, Delaware's economic activity as measured by the coincident index has fallen 1.4 percent over the past 12 months.

**January 2021 DATA: Third District Coincident Indexes**

Area	January 2021*	1-Month Change	3-Month Change	12-Month Change
Pennsylvania	112.5	0.0%	1.2%	-7.8%
New Jersey	121.1	0.8%	0.4%	-5.8%
Delaware	126.0	0.3%	1.2%	-1.4%
US	124.5	0.4%	0.9%	-4.5%

\* Indexed to 2007 annual average. Values are subject to monthly revision.

## **\*\* Potential Impacts of the COVID-19 Pandemic on the January 2021 State Unemployment Rates and the Philadelphia Fed's State Coincident Indexes**

In January 2021, unemployment rates were lower in 33 states (in which the monthly change was considered statistically significant); the monthly changes in the remaining 17 states were considered stable. For nonfarm payroll jobs, statistically significant changes were positive in 20 states and negative in two.

However, the Bureau of Labor Statistics (BLS) noted the following for the U.S. as a whole:

- Despite the over-the-month increase, nonfarm employment in January 2021 was 9.9 million (or 6.5 percent) below its February 2020 level.
- Although unemployment fell in January 2021, the unemployment rate and the number of unemployed people are up 2.8 percentage points and 4.4 million, respectively, since February 2020.

Our map and our three-month diffusion index currently depict changes from October 2020 through January 2021, which continued the broadly positive results from the December report. The monthly unemployment rate is typically the most influential factor underlying a state's coincident index for most states, and the unemployment rate declined in most states on a three-month basis.

Of note, the BLS reported on changes to and aspects of its standard methodology for state estimates that bear particular relevance to movements in the Philadelphia Fed's coincident indexes.

- **Handling reports of zero employment:** The BLS noted that the relationship between firm births and deaths is no longer stable. This prompted a change to its methodology to include some portion of firms that reported zero employment for the period (they are typically excluded). This change resulted in lower payroll job totals for January preliminary estimates, as well as for December final estimates. The latter change contributed to downward revisions of the December coincident indexes for some states. However, for some firms reported employment turned positive in January from zero in December. [See [State Employment and Unemployment — January 2021](#).]
- **Handling misclassifications:** The BLS noted again that in January 2021 an atypically large number of workers were classified as employed, but not at work for “other reasons,” and suggested that some of these workers should have been classified as “unemployed on temporary layoff.” The BLS noted that the national unemployment rate might have been as high as 7.3 percent (not seasonally adjusted) compared with 6.8 percent. Thus, state unemployment rates also may have been higher than estimated, which would imply that the coincident indexes may have increased less than our model indicates. [See [FAQ: The Impact of the Coronavirus \(COVID-19\) Pandemic on the Employment Situation for January 2021](#).]

Finally, the BLS reported two other aspects of its methodology of relevance for the coincident indexes:

- **Greater uncertainty:** The January 2021 unemployment rate estimates met the Census Bureau's standards for accuracy and reliability, even though the response rate for the household survey was about 5 percentage points less than in the 12 months preceding February 2020. [See [FAQ: The Impact of the Coronavirus \(COVID-19\) Pandemic on the Employment Situation for January 2021](#).]
- **Handling outliers:** The BLS routinely examines each state's Current Population Survey inputs for outliers. If an outlier is sufficiently large — passes certain statistical tests — the information is retained or preserved as a level shift. If not, the information is discounted. Generally, the need to implement level shifts does not occur during normal month-to-month processing. For January 2021, level shifts were implemented for most, if not all, states. [See [State Employment and Unemployment — January 2021](#).]

## **\*\* South Carolina Employment and Wages Data**

According to the Bureau of Labor Statistics (BLS), it is still working with its South Carolina partners to finalize QCEW data for the first quarter of 2019 and BED data for the fourth quarter of 2018 and the first quarter of 2019. South Carolina data had shown unusual movements beginning in early 2018, potentially as a result of changes that coincided with a modernization of the South Carolina unemployment insurance system. Data from both QCEW and BED for the aforementioned months are still considered to be preliminary. [Read the report](#).
